software Windows - (Full Version) - Scantool (<http://www.scantool.net/net113win.html>) is the best. The present invention relates to a fan, and particularly to a fan including a light source. An existing fan mostly utilized is a blower fan which is rotatable and driven by a motor. The existing blower fan includes a fan casing having blades that are rotatable by receiving the torque of the motor, and a support plate is securely engaged with the fan casing.

---

The motor is fixedly mounted on the support plate, and the fan casing is substantially fixed on the support plate. The support plate is generally a metal piece and is made by stamping a metal sheet or machining an iron or steel plate, so that it is easy to manufacture. However, the motor is fixed on the support plate that is a metal piece, and the motor will generate heat during working. In order to dissipate the heat, a heat sink is generally used to attach on the

back of the motor. The heat sink is a metal piece that is larger than the motor, and may be made of aluminum, iron, or a metal sheet. The heat sink is necessarily larger than the motor, thus resulting in a space between the support plate and the heat sink, and the fan is not able to be tightly attached to the support plate and the heat sink, thus affecting the effect of heat dissipation. In view of this, it is desired to provide a fan which can overcome the above
