1. Field of the Invention This invention relates to electrical circuit interrupters. More particularly, the invention relates to an automatic reset circuit to reset the tripping time of the circuit breaker. The automatic reset circuit is preferably positioned on the circuit breaker and can be reset independently of the tripping time reset circuit of the circuit breaker.
2. Description of the Related Art Circuit breakers are used to protect electrical circuitry from damage due to an over current condition. When over current protection is desired, a current sensing device is placed in series with the protected circuit. In order to provide protection, it is necessary to trip the breaker to an open, i.e. off, condition when the sensed current

exceeds a pre-selected value. This trip is normally initiated when the sensed current exceeds a set point and an armature of the current sensing device has re-magnetized a trip coil. In some circuit breakers, the circuit breaker is reset to an off condition after the tripping time has expired. The tripping time is a predetermined time period after the circuit breaker is tripped. One method of resetting a circuit breaker to an off condition after the tripping time has expired is to have a bimetal close a reset circuit which opens an in-rush resistor or shunt. In some circuit breakers, the reset circuit is responsive to an operator reset button and the operator has to manually reset the breaker. Another method of resetting the breaker is to have a reset spring stop a trip coil. The trip coil is connected in series with the in-rush resistor or shunt. Once the reset spring has stopped the trip coil, an armature of the trip coil which causes the in-rush resistor or shunt to be energized will also energize the reset circuit and thereby open the in-rush resistor or shunt. It is desirable to have some type of reset circuit which
