What's New in the Network Configuration Tool?

In the previous example the UserName and Password fields will be empty since it's the first time you are using the Configuration Tool. After you change the configuration settings click OK to save the changes. You will see the configuration settings applied automatically. You can click on the system properties of any item, like Computer name, to see the changes. You can also right click on the item you want to configure and select "Properties" and go through the dialog to see the setting you applied. If you are moving from Windows XP to Windows 7 The Network Configuration Tool is now part of the operating system and is included in Windows Vista and Windows 7. In the Windows XP operating system you could use the Net User and Net Group tools to configure the network settings. Network Configuration Tool in Windows 7 Use a modified version of the Network Configuration Tool in Windows 7 to configure the network settings by selecting the network provider in which you want to configure the network settings and then choosing the right network settings for the network provider. The Windows Vista Operating system, unlike Windows XP, has Network Configuration Tool that is included in the operating system. In Windows 7 there is no such Network Configuration Tool and the user has to download and install the Network Configuration Tool from the Microsoft website. The Windows XP operating system has several commands to configure the network settings and the user has to select the network setting manually. But in the Windows Vista and Windows 7 operating system, there is a single command to configure the basic network settings like Network Provider, DNS Server, and Domain Name/Workgroup. The Network Configuration Tool in Windows 7 consists of two parts. The "Provider" tab is for the basic settings like Network Provider and Domain Name/Workgroup. The second tab is for advanced settings like DNS Servers, DHCP Server, and Proxy Settings. Summary: The Network Configuration Tool is an application included in the operating system that you can use to configure basic settings like Domain Name/Workgroup, Computer name, IP addresses for each Adapter and Computer and the default Gateway. You can use the Network Configuration Tool to configure the network settings of the Windows operating system. You can choose the Network provider and select the basic network settings like IP addresses, Workgroup/Domain name, Default Gateway and Computer name. You can install the Network Configuration Tool by right-clicking on the Windows 7 "Start" button and selecting "Programs and Features". Click "Add a Feature" and then scroll down and select "Network Configuration Tool" to add it to the operating system. Use a modified version of the Network Configuration Tool to change the basic settings of the operating system. The modified version of the Tool will be available only for the network providers that are available in the Microsoft website. Learn more about the Network Configuration Tool When you want to change the basic settings of the Windows operating system from the command
