It is a powerful photo editing tool akin to Photoshop's image adjustment tools, but it also includes several interesting features such as brushes, spot healing and color correction. The features only differ from its Lightroom counterpart in many ways. Lightroom's similar color and tone tools are not included in ColorGrade, and what is there is only applicable for RAW images. It has been expanded to include more organization options, such as presets and presets stacks. While I personally like to keep my 8GB library sorted into albums, I'm sure you'll make your own selection out of the preset and preset stacks. You can merge the different **Preset Stacks** into a **Preset Set**, which is analogous to a **Preset** you can apply to any image in the library. You can also group images that share a common characteristic, such as all the images that have their exposure, white balance or color temperature adjusted in the same way. You can also create an **Exposure Accent,** which is a tone that is applied to your image when you create a new image. This feature is useful for making built-in HDR images look better.

This is a quick and easy way to tell people and they are super fun to create as well. **What It Does:** Photoshop is more like a hobby now days, there are only a handful of CRON jobs in the design field that know and use it. But this has not stopped it from having huge potential. CRON jobs allow you to quickly copy and paste into another image, then tweak the design. One great thing about this is you can then save it to the layers and then save that image as a PSD. For the first time, you can add multiple nodes to the workbench. This can save you time while working if you need to create multiple definitions of the same node. In the past, you would have to duplicate and edit individual nodes to create more than one. By creating multiple definitions, you can use a single node to draw the whole shape and then duplicate it to create multiple nodes with different radii, angles, or colour. To add a new node to the workbench, head to Layer > New > Rectangular or Elliptical Node. We're also excited for the new custom tools you can access from the Type tool panel. Adobe says that these tools will suit a wide range of creative types, such as those involved in typography and texture design. The custom tools will be available in a new tool-set panel at the bottom of the Type tool panel. To access the tool-set, head to Toolbox > Type Tools. Whichever tool you have selected, head to Edit > Customize to access and customise the tool. The new Content Aware Spot Removal tool will help you quickly spot areas of a photo that are unsatisfactory. An example of how this could be used is if someone is positioned at the middle of your image. That person, or a background object, could be distracting and negatively impact your image. Head to Content-Aware Fill to spot and remove the unwanted areas of an image. You will also be able to see the effects of a Smart object directly in the Layers panel when using the Warp Tool. Now you can evaluate the Smart object directly and see how it reacts to the different effects. Simple adjustments, such as expressions, will also be shown directly in the Layers panel.
